

THE EFFECT OF PROBLEM BASED LEARNING (PBL) IN SCIENCE EDUCATION AND CHARACTER BUILDING

Dalifati ZILIWU

IKIP Gunung Sitoli, Nias, Indonesia

I. Background

Many problems in teaching learning process of Science education in Junior High School level in Indonesia. Low achievement in science education is an endlessly classical situation in schools. This study was applied an experimental method to seek the effects of Problem Based Learning model in teaching science in Junior High School. The application of Problem-Based Learning (PBL) as a way to help pupils is to make the synthesized foundational of knowledge and to better prepare pupils for practice (Hirshfied and Koretsky, 2017). Hamdani (2011: 87) argued that the problem-based learning or problem based instruction emphasizes life problems that are meaningful to pupils and the role of the teacher in presenting problems, asking questions, and facilitating investigation and dialogue. Merritt et al (2017) state that typically problems are ill-structured, requiring pupils to work actively and collaboratively in small groups to investigate, pose questions, gather information, and carry out the work necessary to resolve the problem. Pupils engaged in PBL “increase knowledge

and develop understanding by identifying learning objectives, engaging in self-directed work, and participating in discussions” (Merritt et al., 2017).

Pupils’ level of motivation reflects on their engagement and contribution in a learning environment (Gopalan et al., 2017). Motivation to learn is a competence acquired through general experience that is predominantly stimulated through modeling, communication of expectations, and direct instruction or socialization by significant others (Koca, 2016). Improving pupils’ learning motivation is important for learning process because motivation will affect how teachers and pupils interact with learning materials. Therefore, in order to be able to improve the quality of learning, teachers should be able to motivate pupils to be more actively engaged during the learning process (Kurniawan et al., 2018). Education in the school environment will not be separated from the learning process, in the process of implementing learning is influenced by various factors, both from within the individual and from outside the individual itself. Motivation can be distinguished into two groups namely factors that exist in the individual itself (internal factors) and factors that exist outside the individual (external factors), one of these factors is motivation. The differences between intrinsic (Self-motivated) and extrinsic (External) motivation are important when choosing suitable reward systems (assessment types and criteria) and instructional strategies (condition for learning) (Bates, 2015). Next, when pupils perceived more autonomy support in class, they have higher self-worth, cognitive competence, internal control, and mastery motivation (Cetin, 2016). Giving control to the pupils helps to maintain pupils’ interest and motivate them to take responsibility for their own learning. Therefore, Indonesian government also has introduced the character building process in educational sector.

Character education is assumed helping learning process (Hasibuan and Matondang, 2017). Character is a characteristic that is owned by individuals. These characteristics are original and rooted in the individual's personality, and are machines that encourage how a person acts, behaves, says, and responds to something". Character-building and learning of ethical and moral values have been regarded as the first and foremost goal of education, and many educationists have emphasized it (Freeks, 2015). Character education focuses on moral concepts, manners and civility, and shapes pupils’ personality, values, attitudes and habits in their development; Good character consists of the virtues where virtues are objectively good human qualities such as, wisdom, honesty, kindness, and self-discipline (Chowdhury, 2016).

In Sattar and Aftab (2017) study, “children learn a repertoire of behaviors that when repeated become habits, which in turn facilitate the formation of good character”. With their own actual self, pupils can look at self-discipline, responsibility, trustworthiness, courage and self-discipline. Character traits such as: honesty, respect, empathy, kindness, and caring play into effect with pupils who have relationships with classmates, teachers, friends and family

(Sattar and Aftab, 2017). Therefore, in preparing the learning plan the teacher needs to analyze the initial abilities and characteristic of pupils.

For psychologists and teachers alike 'motivation' has been one of the key concepts used to explain different levels of performance. It purports to explain differences in the amount of effort applied to learning tasks and is thus expected to be strongly related to differences in levels of performance. At its simplest, motivation has been related to the amount of intellectual energy typically used in learning activities, and this led to a belief that motivation could be seen as a stable characteristic of the individual, on a par with personality (Arens et al, 2015). Cognitive theories, in fact, provided an answer to behaviorism by focusing on learning as a process of sense-making, that is, how individuals develop knowledge structures, construct mental representations, and in turn access these resources to answer questions, solve problems, and develop new understandings (Shepard et al., 2018).

2. Theoretical Reviews: Problem Based Instructions Learning Model and Character Education

In addition to the concept of learning integrated thematic model is also needed learning that can make pupils active, critical, able to solve problems and combine several concepts. One of them is a *Problem-based Learning Instruction* (PBI). This learning model emphasizes the problems of life that are meaningful to pupils and the role of the teacher in presenting problems, asking questions, and facilitating the investigation of the department. Istarani (2011: 32) argues, "Problem Based Instruction is one model of learning that is centered on pupils by way of confronting the educators with various problems faced in their lives". PBL is an instructional pupils-centered approach which utilizes carefully constructed real-world, ill-defined problems as a context for pupils to extend their prior experiences and knowledge through discussion and self-directed and collaborative learning that fosters the development of problem-solving and reasoning skills (Zeng at al, 2016). During the instructional process, PBL promotes learning through the process of "learning by doing", whilst the teacher assists the process and plays the roles of a facilitator. This learning process is intended to simulate actual professional practices (Masek, 2015).

2.1. The Problem Based Instruction

I) learning model can help pupils practice using various concepts, principles and skills that they have learned or are learning to solve problems even to solve everyday problems. By implementation of the PBI model, many activities that can be carried out by pupils. So that it motivates pupils to be able to find and understand the concept with thematic learning. Besides that, ability

critical thinking of each individual is different, depends on frequent stimulus or exercise do. Ability to think critically cannot develop along with development body of each individual. This ability is related with the ability to identify, analyze, and solve problems creative and logical thinking so that it produces right judgment and decision (Fakhriyah et al, 2016). PBL's application in the teaching-learning process helps pupils to understand and interpret knowledge deeply, to configure knowledge, to achieve internal motivations, and to become rational individuals (Damirel and Dağyar, 2016). PBL is an instructional method where relevant problems are introduced at the beginning of the instruction cycle and used to provide the context and motivation for the learning that follows (Malik, 2015).

Chiang and Lee (2016) state that in PBL environments, pupils learn primarily by constructing knowledge and making meaning through iterative processes of questioning, active learning, sharing, and reflection. It service learning emphasizes educational opportunities that are interdisciplinary, pupils-centered, collaborative, and integrated with real-world issues and practices (Chiang and Lee, 2016). The efficacy of constructivist and inquiry-based approaches is well-documented in the field of science learning. Studies by educational psychologists and cognitive scientists have indicated that problem- and project-based learning centered around authentic problems are more likely to motivate pupils to think deeply about the domain being learned. In such approaches, pupils are required to take on the responsibility of learning. Such pupils also tend to be more motivated and to become better learners. Involvement with the subject matter, as when pupils work on a challenging task, tends to hold pupils interest and ultimately leads to an increased retention of pupils in science.

2.2. Motivation and Pupils Character.

Motivation

Pupils' motivation is all about what they desire to express during learning. Sometime pupils are more motivated and sometime they are not because their source of motivation can be different. Motivation, being a vital phenomenon, foretells the academic future of pupils. Motivation is to be fixed with the pupils' commitment, engagement and fortitude to accomplish academic work. The commitment and motivation can be increased by collaborative learning rather than mere teaching via lectures. Motivation plays an important role in the pupils' career (Tanveer et al, 2012). Motivation stimulates pupils to move towards the attainment of their goals, it maintains their stamina and reinforces them to improve their potential as well. Motivation is not a stagnant phenomenon; it varies from pupils to pupils. Motivation is an impulse that comes from within itself and from outside the pupils itself to achieve the desired learning achievement. Learning motivation is a condition which activates behavior and gives it direction (Kori et al., 2016) of the pupils. Based on the explanation

above, motivation is very important in achieving a certain goal that is felt useful for the life and desire of individuals to achieve something.

Motivation can be divided based on the different reasons that give rise to an action. In general, motivation can be divided into intrinsic motivation and extrinsic motivation (Kori et al., 2016). For instance, Wikipedia defines intrinsic motivation as “the self-desire to seek out new things and new challenges, to analyze one’s capacity, to observe and to gain knowledge” (Kruglanski et al., 2018). Kori et al. (2016) explained that intrinsic motivation means that a person does something because it is inherently interesting or enjoyable, and extrinsic motivation means that a person does something because it leads to a separable outcome. It has been found that intrinsic academic motivation correlates positively with school achievement (Kori et al., 2016).

2.3. Purpose of Character Formation.

Character building in education refers to moral lesson (Hasibuan, and Matondang, 2017) in class room and outside. Furthermore, Siregar et al (2018) state that character education describes curriculum developed to teach children about essential traits needed to build good character. It is a deliberate effort to develop noble character and cultivate core virtues that are worthy for the individual and society as a whole (Siregar et al, 2018). The long-term goal is nothing but basing themselves on the individual contextual active responses that they receive, which in turn sharpens the vision of life that will be achieved through a continuous process of self-formation. Character education in science plays important and dominant roles in spearheading technological advancement, promoting national wealth, improving health and accelerating industrialization which aid development in many countries (Argaw et al, 2017). Science is not merely scientific knowledge, but it contains three dimensions, namely the first scientific content that contains various facts, concepts, law, and theories. This dimension is the object of human scientific study. The process of carrying out activities related to science is called science process skills. The third dimension focuses on the characteristics of the attitude and scientific character (Tawil and Liliyasi, 2014).

3. Research Design

This research applied an experimental design in educational study. Experimental method was to determine the impact of an intervention on an outcome for a group in a study. It has a discrete place due to their effectiveness to establish cause-effect relationship and, to make manipulations and to provide

control over the variables (Köksal, 2013). The basic idea underlying all experimental research is really quite simple; try something and systematically observe on what happens (Lindawati et al, 2017). In this study, there are two the research variables namely; Problem Based Instruction Learning Model as variable X (independent variable) and Learning Motivation and Pupils Character as Y variable (dependent variable).

3.1. Population

The population is the whole of the research data source and was determined as the research respondent. The population in this study were Second Grade pupils, amounting to 22 people who were then determined as research respondents.

3.2. Variable Characteristics

In this study, researcher used two variables, which will be the first variable is the Model of Learning Based Instructions while the second variable is the Motivation of Learning and Pupils' Character.

a. Variable X (Model Learning Based Instruction)

Problem Based Instruction Learning Model is one of the learning models that are centered on pupils by confronting these educators with various problems faced in their lives, hereinafter referred to as X variables.

b. Variable Y (Learning Motivation and Pupils Character).

Motivation to learn is an impulse or the overall driving force in pupils that gives rise to learning activities, which ensures continuity of learning activities and gives direction to learning activities, so that the objectives desired by the subject of learning can be achieved, while the character of pupils is a characteristic possessed by objects or individuals, hereinafter referred to as variable Y.

4. Data and Discussion

From the results of observations conducted by researchers at the SMP N 5 Namohalu Esiwa at the time learning activities were taking place found that the implementation of the learning process was still centered on teachers who relied on lecture methods in teaching, so pupils were passive in learning activities. The use of instructional media by teachers is still lacking, so that in learning activities the teacher can only convey material or examples that can be known to pupils in everyday life. It is ironic in learning activities that pupils pay little attention and understand the explanation of the subject matter from the teacher, some pupils only see but do not care, and some pupils do not see the explanation of the front class at all so that it influences the character of the pupils. Then very often pupils

are late (not on time) to work on and submit Science assignments, low pupils motivation in learning, so the impact of some of these problems results in poor grades, so that many pupils still do not pass based on the specified standard score.

From the results of questionnaire processing and pupils learning achievement values, it can be seen that the *Problem Based Instructions* Learning Model has a close influence on Pupils Motivation and Character Learning. Based on the results of this study, and then given the answer to the main problem that is there is a significant influence between the *Problem Based Instructions* Learning Model on the Motivation of Learning and Pupils Character in Science at SMP N 5 Namohalu Esiwa in 2017/2018 Academic Year.

This can be seen from the results of the questionnaire which was circulated by the author to the respondents showing the calculation of the correlation coefficient among the variables obtained $r_{xy} = 0.708$ which then consulted on the criterion of product r or moment (attached) for 95% confidence intervals or significant levels 5% of $N = 22$ is 0.381. These results show positive results. If the value of $r > 0$ means that there has been a positive linear relationship, namely the greater the value of X (independent), the greater the value of the variable Y (dependent)". This means that with the existence of the *Problem Based Instruction* Learning Model, the Learning Motivation and Pupils' Character are also getting better and improved. So the Learning Model of Problem Based Instruction has an Influence on the Motivation of Learning and Pupils Character in Science at SMP N 5 Namohalu Esiwa in 2017/2018 Academic Year.

The influence of the use of the application of the Group Investigation and Motivation Learning Model in Science on the second grade of pupils learning outcomes in the 2017/2018 academic year was 5.363, while the remainder of 94.637 was influenced by other factors. Other factors are not examined by researchers because of limited time, ability and funds, so researchers provide opportunities for other researchers to examine them. The equation of this study with previous research is that this study together discussed the learning model.

The difference between this research and previous research is that the previous research conducted quantitative research by discussing the use of the Application of Group Investigation and Motivation Learning Models and their effect on Learning Outcomes, while the current research conducted quantitative research, but by discussing the Learning Model of Problem Based Instruction on Learning Motivation and its influence on motivation and character pupils. The findings of the study indicate that there is a significant influence between the Learning Improvement Strategy of Thinking Ability and Pupils Learning Outcomes in the Learning of Integrated Science in SMP N 5 Namohalu Esiwa 2017/2018 Academic Year.

5. Conclusions

Data interpretation gives two conclusions:

5.1. The influence of the use of the application of the *Problem Based Instruction* (PBL) in Science on the second grade of pupils learning outcomes in the 2017/2018 academic year was 5.363, while the remainder of 94.637 was influenced by other factors.

5.2. There is a significant influence of the *Problem Based Instruction* pupils motivation and Character in SMPN 5 Namohalu Esiwa in 2017/2018 Academic Year. This was based on testing the hypothesis by using the one-party t_{test} at a significant level of 0.05 where $t_{\text{count}} = 6.497 > t_{\text{table}} = 1.725$.

Təhsilin alınması və xarakterin formalaşmasında Elmdə Problem əsaslı öyrənmə metodikasının təsiri

Dalifati Zilivu

İKİP Qununuq Sitoli, Nias , İndoneziya

Bu məqalədə Elmdə Problem Əsaslı Öyrənmə modelindən istifadə edərək, şagirdlərə xarakterin formalaşmasını öyrədən dərs ilə bağlı motivasiyanı artırmaq üçün bir sıra təsiredici faktorlar araşdırılmışdır. Araşdırmada orta məktəb səviyyəsindən başlayaraq, Problemlərə əsaslanan öyrənmə modelinin effektivliyi təhlil edilmişdir. Aparılan çalışmada t_{test} - birtərəfli testdən istifadə edilərək 0,05 % vaciblik müəyyən edilmiş və $t_{count} = 6.497 > t_{table} = 1.725$ olduğu qeyd olunmuşdur. Nəticə əsasında belə qənaətə gəlini ki, Problem Əsaslı Öyrənmə modeli vasitəsilə tədris və təlim prosesi daha aktiv və səmərəli olur; şagirdlərin məlumat toplamaq və tapşırıqları daha yaxşı etmək qabiliyyəti güclənir, eyni zamanda xarakterlərini daha güclü formalaşdırmaq üçün həvəslərini artırmaq imkanlarına malik olurlar.

Açar sözlər: Problem əsaslı öyrənmə, tədris ocağı, motivasiya, gücləndirmək, elmi dərs, xarakter formalaşması

РЕЗЮМЕ

Влияние проблемных методов обучения в науке на приобретение и формирование образования

Далифати Зиливу
ИКИП Гунунуг Ситоли, Ниас, Индонезия

В этой статье рассматривается ряд влияющих факторов, которые повышают мотивацию учащихся к изучению и формированию у них характера с использованием проблемной модели обучения в науке.

В исследовании анализировалась эффективность проблемно-ориентированной модели обучения, начиная с уровня старшей школы. В проведенной работе используя односторонний тест – Ttest, определили 0,05% значимости, и было отмечено, что $t_{count} = 6,497 > t_{table} = 1,77$. В результате был сделан вывод о том, что процесс преподавания и обучения с использованием модели проблемного обучения является более активным и эффективным. Способность учащихся собирать информацию и выполнять домашнее задание повышается, и в то же время у них появляется возможность развивать свою мотивацию для формирования более сильного характера.

Ключевые слова: Проблемное обучение, центр обучение, мотивация, усиление, научный урок, формирование характера
