INVESTIGATION OF OPTIMISM AND LOCUS OF CONTROL IN TEACHERS

Mehmet BILGIN

IMBL University (Institute of Management, Business and Law), Rostov-on-Don, Russian Federation
Ministry of National Education, Republic of Turkey

Introduction

Teachers, who take the input from the society, give the output back to the society, affect the society and are influenced by the society and who work for the schools which are open system in this aspect are very important factors. Schools are in relationship with all people who will contribute to the school by various possibilities, parents, graduates, community around them, education authorities at the official, local and national levels, inspection boards, universities, people that have direct and indirect relation with education and teaching (Kelly, 2004).

The teaching profession is consisted of activities that are including tiring, emotionally corrosive and long process. Personality characteristics such as trust, self sufficiency, optimism and extroversion, which make them strong and durable, can be seen as a key to the success of teachers. The high level of these qualities seems important for teachers' self-realization and happiness (Seligman & Csikszentmihalyi, 2000).

Personality is defined as structures that come together over time in determining emotional, behavioral and cognitive forms and indicate who the individuals are by pointing out the psychological qualities (Mount, Barrick, Scullen & Rounds, 2005). Personality is reflected from the individual's thoughts and movements, and defines each person's unique aspects (Deng, 2013). Personality characteristics become more stable as individual's development progress and affect human relationships with its social behaviours (Jenkins, Wright & Hudiburgh, 2012).
Investigation of Optimism and Locus of Control in teachers.....

Individuals with high extroversion level are considered as sympathetic individuals who are easy to make relationship with people, who like to be with people, are prone to cooperativeness. In other words, introverted individuals are considered shy and they are closed to the inside, distant from the people, who are distant from people, have tendency to silence (Loveland, 2004).

With their different personality structures employees importantly influence the management process and the institutions they work. Basically, a different personality structure derives from the fact that individuals react differently to the events they meet. While individuals who think that causes of the events are under their control are successful; individuals that connect it to external factors such as luck and fate, they experience failures. In the teaching profession, the concept of locus of control can be considered as an important variable at the point of expressing of employees' behavior. When considering employees who are successful in their work life, they qualify themselves more active and effective individuals (Beukman, 2005).

Locus of control shows the natural capacities of people that they use for doing a job. While internal control express that on the experiences there is a personal control existed, the external control, express that variances, except for individual, such as: luck, other people, creator and fate are effective on the experiences. On the internal controlled individuals in the results of experiences the belief and expectation sovereign that their own behaviours are effective. (Wong-McDonald & Gorsuch, 2004).

On the other hand, individuals with external locus of control develop an attitude that their personal efforts will not be effective on reaching to prizes and avoiding from punishment. This situation will lead individual to be pessimistic. Hopeful people are motivated much in dealing with difficulties and for this reason they are resisted. People with high self- sufficiency and self- confident can easily transfer and apply their hopes, optimistic attitudes and durablities to their life (Luthans, Youssef & Avolio, 2006).

Optimism, together with the increasing interest in positive psychology today, is considered as a positive and protective personality characteristic (Benson, 2007). For the individuals who have to maintain their lives under adverse conditions, they are seen as a factor related to optimism for their ability to find future goals, meaningful attachment to life, brutality and self-healing. It is observed that a positive perspective takes place in all experiences of optimistic individuals.

Like other institutions, schools also desire to have teachers who are knowledgeable, capable, competent, and at the same time motivated to pursue their goals in order to achieve their goals. Institutions are influencing and
changing workers' motivations, perceptions of trust, optimism about work and pessimism. The performance and productivity of a teacher who is pessimistic will be low. Therefore, since the motivation of the teacher decreases his productivity will go down and the success of the school will also be affected.

If teachers have positive feelings about their work and future then they are productive. It is a fact that with the development of technology and industry people want to increase their living standards, redirect them to different perspectives in business, school, family life, and keep themselves away from thinking about the future.

Especially the business life that is filling a very important part of life is influenced by these two personality characteristics. The performance of the individual in the business life is also related to the level of control and optimism he has and the overlap of his personality characteristics with his profession. Because the profession is not a temporary job to earn an individual's life, but a constant pursuit of interest, knowledge and skill that requires a certain formation.

It is known that teachers have an important influence on the success of schools. Individuals educated by teachers return to them as riches or poverty of nations. Therefore, teachers' importance is great in terms of countries and the need of making research on them.

**Method**

The population of this research conducted in accordance with the relational screening model is composed of teachers who study at Kayseri. The sample of the research comprises 127 male (46%) and 150 (54%) female teachers, 277 teachers totally, selected among with the random sampling method.

**Data collecting tools**

1. *Optimism scale*

   In this study, the "Optimism Scale" developed by Scheier & Carver (1985) was used to measure the optimism levels of the participants. The Optimism Scale measures the degree which individuals have positive expectations about their experiences in general. The Optimism Scale, which has a five point likert type, consists of 12 articles, 4 of which are positive, 4 are negative and 4 are also in filler quality. The scale has a one-factor structure. In the result of the calculation of negative articles by reversing them the total points' highness indicate the individuals' optimism levels' highness Scheier & Carver (1985). They conducted validity studies of the original scale, and it was determined
that all of the articles were collected under a single factor as a result of the explanatory factor analysis (Scheier and Carver, 1985). Depend on this situation, it is stated that the scale has a one-factor structure. In the reliability studies conducted on the scale, the internal consistency coefficient of the scale was .76 and the test retest reliability coefficient was found as .79 (Scheier & Carver, 1985). The Optimism Scale was adapted to Turkish by Aydın & Tezer (1991). Explanatory factor analysis was performed primarily during the Turkish adaptation studies of the scale. In the explanatory factor analysis, the Turkish version of the Optimism Scale was found to be a one-factor scale. In addition, the relationship between the scale and Beck Depression Scale was examined on two groups of university students, and significant correlations were found at -.55 and -.45 (Aydın & Tezer, 1991). Then, by Kararmak (2007) both exploratory and confirmatory factor analysis were conducted on the scale. The scale exhibited a two-factor structure that accounts for 55% of the total variance as a result of explanatory factor analysis. However, it is grabbing attention when this situation is caused by the dissociation of the positive and negative substances as two separate factors. For this reason, it is stated that the scale is considered as the single factor as in the original. The confirmatory factor analysis results also in quality of supporting 4 positive 4 negative in total 8 articles were gathered under one factor (Kararmak, 2007).

In the reliability studies conducted on the Turkish version of the scale, both the internal consistency coefficient and the test retest reliability coefficient were calculated. In these studies, it is stated that the internal consistency coefficient of the Optimism Scale was .72 and that the test retest coefficient conducted for a four-week period was found as .77 (Aydın & Tezer, 1991). The internal consistency coefficient realized by Kararmak (2007) it was found as .75. The internal consistency coefficient of the Optimism Scale calculated within the frame of this research and it is .72.

2. Rotter's internal-external locus of control scale

The Locus of Control Scale is a 29-item, forced-choice questionnaire developed by Rotter (1966) to measure general expectations about skill, luck and fate oriented perceptions. 6 of the items are diversions, 23 of them are composed of optional statements about internal and external beliefs. The highest score is 64, the lowest is 0 in the scale. Each item covers two choices of the forced choice rating. For example, (2.a) most of the unhappiness in life is about bad luck at the least. (2.b) bad luck of people is the result of their mistakes (Dağ, 1991). While 23 items are included for the evaluation, 6 items are not included in the calculation because they are used as diversions to hide the purpose of the scale (diversion items: 1,8,14,19,24,and 27). In addition, the (a) choice of items (2,6,7,9,16,17,18,20,21,23,25,29) are awarded 1 point each while the (b) choice of items (3,4,5,10,11,12,13,15,22,26,28) are awarded 1 point each. Higher scores indicate that individual has the external locus of
control; lower scores mean that individual has the internal locus of control. The reliability and validity studies of the LCS were performed by İhsan Dağ (1991) in Turkey. In the reliability and validity studies, the test-retest reliability coefficient was calculated to be .83; Cronbach's Alpha internal consistency coefficient .70; and the reliability coefficient calculated with the Kuder-Richardson 20 formula .68. The scale is suitable for group application while it can also be answered by the individual alone. There is no time limitation for application.

**Analysis of data**

The data obtained in the research were analyzed with Pearson's Product Moment Correlation Coefficient to see the relationship between variables and the Multiple Regression Analysis to identify the variables that predict optimism and locus of control.

**Findings**

Table 1. Correlation analysis results related to locus of control and optimism levels of teachers

In the Table 1 relationship between optimism and locus of control of the teachers were examined. There was a positive and meaningful relationship found between locus of control and optimism (r .262 p<.000).

There was a negative and meaningful relationship found between external locus of control and optimism (r -.119 p<.048). There was a negative and meaningful relationship found between internal locus of control and external control (r -.048 p<.000).
Multiple regression analysis related to prediction of optimism in teachers given in the Table 2.

</tbody>
</table>

In the Table 2 regression analysis results of optimism and locus of control sub dimensions given. When dual and partial correlation values between dependent and independent variances were examined while there was a positive and meaningful correlation between optimism and internal locus of control (r=.119), when other variances were taken under control the correlation between optimism and internal locus of control found as r=.110. It is seen that there is a negative correlation between optimism and external locus of control (r= -.262). When other variances were taken under control the correlation between optimism and external locus of control predicted as r= -.258.

Briefly, when multiple regression analysis results were examined related with the prediction of optimism in teachers there is a meaningful relationship between internal and external locus of control (R=.283, R²= 0.80, p<.001). With the mentioned two variances it explains approximately 9 % percent of the total variance of optimism in teachers.

According to standardized regression co-efficiency (β), the importance order of predicted variances on optimism; external locus of control (β=.756 ) and internal locus of control (β=.445).

**Result and discussion**

The relationship between the level of optimism and the locus of control was examined in the teachers. There was a positive and meaningful relationship between internal locus of control and optimism. There was a negative and
meaningful relationship between external locus of control & optimism and internal audit focus & external audit focus. In a study of the relationship between happiness, creative thinking, and locus of control, it was emphasized that there is a positive relationship between internal locus of control and optimism. (Pannels & Claxton, 2008). It is thought that the relationship between hopefulness and suicidal risk is negative in the literature. Myers & Reynolds (2000) examined the relationship between supervisory focus, self-respect and optimism in their research with 154 university students. According to the results of the research, it was found that the individuals who use effective coping strategies in the events related to the locus of control had high comparative optimism tendency and the level of the comparative optimism decreased when the level of self-respect decreased. Chang, Sana & Yang (2003) have found similar findings in their study of optimism, pessimism and psychological adjustment in different cultures. Day & Maltby (2003) found a positive relationship between positive thinking and feeling lucky, and a negative relationship between depression, anxiety, and irrational beliefs and feeling lucky. When people think they are lucky (external locus of control) leads them to feel safe, controlled, increase their positive thinking, and maintain their psychological well-being. It is known that no doubt good luck is an irrational thought; However, it is known that, in another irrational thought, it has quite different effects than bad luck.

When individuals are given the opportunity to experience their own pride, it is seen that such experiences are more optimistic than those who live. Under these circumstances, individuals are able to develop more positive thoughts, are more motivated and feel better in psychological terms, are more successful in determining their personal goals, and are making more efforts to achieve them (Grant & Higgins, 2003). The teaching profession is made up of activities that are tiring, emotional and time-consuming. Positive personal characteristics such as strength and durability, trustworthiness, self-efficacy, optimism, extroversion, hope and psychological endurance can be seen as the key to the success of teachers. The high level of these characteristics considered important for teachers’ self-realization and happiness (Seligman & Csikszentmihalyi, 2000). According to McKenna (1993), we are more optimistic about events that we think they are under our control, that is, as control over events increases, so does optimism. As the level of optimism diminishes, a prediction has been made that the belief in external locus of control will increase. In other words, it has been argued that individuals who are in the belief of external control are likely to have more negative expectations about the future and exhibit a pessimistic attitude. Especially the business life that is filling a very important part of life is affected by these two personality characteristics. The performance of the individual in the business life is related to the level of control and optimism that he has and the covering of personality characteristics with his profession.
Recommendations

In the result of our research and in the light of revealed datum there are suggestions for the institutions and for the researchers that will do researches about this subject.

- In the teachers’ assignment besides the verbal and written exams for the measuring of vocational knowledge locus of controls and optimism levels should also be considered and ordered and also priority should be given to teachers with positive personality characteristics.
- Making collaboration with the related departments of universities teachers’ internal locus of control and optimism levels should be increased.
